## Problem 1

(a)

$$P(N = 0) = 1 - 0.25 = \boxed{0.75}$$

(b)

We want  $P(N = 0|R = 0)$ , we know that

$$P(R = 1|N = 0) = P(E = 0)P(R = 1|E = 0, N = 0) + P(E = 1)P(R = 1|E = 1, N = 0) = 0.01$$

$P(R = 0|N = 0) = 0.99$  and thus from bayes law we have

$$\begin{aligned} P(N = 0|R = 0) &= P(R = 0|N = 0) \frac{P(N = 0)}{P(R = 0)} \\ &= 0.9 \frac{0.1 \cdot 0.75}{P(R = 0)} \end{aligned}$$

To find  $P(R = 0)$  we must find  $P(R = 1)$ ,

$$\begin{aligned} P(R = 1) &= P(E = 1)P(N = 1)P(R = 1|E = 1, N = 1) \\ &\quad + P(E = 1)P(N = 0)P(R = 1|E = 1, N = 0) \\ &\quad + P(E = 0)P(N = 1)P(R = 1|E = 0, N = 1) \\ &\quad + P(E = 0)P(N = 0)P(R = 1|E = 0, N = 0) \end{aligned}$$

$$P(R = 1) = 0.9 \cdot 0.25 \cdot 1 + 0.1 \cdot 0.75 \cdot 0.1 + 0.1 \cdot 0.25 \cdot 0.1 = 0.235$$

Therefore  $P(R = 0) = 1 - P(R = 1) = 0.765$ , thus

$$P(N = 0|R = 0) = 0.99 \frac{0.75}{P(R = 0)} = \boxed{0.97}$$

(c)

We have

$$\begin{aligned} P(E = 0, N = 0|R = 0) &= \frac{P(E = 0, N = 0, R = 0)}{P(R = 0)} \\ &= \frac{P(R = 0|E = 0, N = 0)P(E = 0)P(N = 0)}{P(R = 0)} \\ &= \frac{(1 - P(R = 1|E = 0, N = 0))P(E = 0)P(N = 0)}{P(R = 0)} \\ &= \frac{0.9 \cdot 0.1 \cdot 0.75}{0.765} \\ &= \boxed{0.088} \end{aligned}$$

This intuitively makes sense because we need two conditions to occur, equipment broken and neuron spike not occurring.

(d)

Let us consider the case  $E = 1, N = 0$  given  $R = 1$  we have

$$P(E = 1, N = 0|R = 1) = \frac{P(R = 1|E = 1, N = 0)P(E = 1)P(N = 0)}{P(R = 1)}$$

Since  $P(R = 1|E = 1, N = 0) = 0$ , we thus have  $P(E = 1, N = 0|R = 1) = 0$ . However

$$\begin{aligned} P(E = 1|R = 1) &= P(R = 1|E = 1) \frac{P(E = 1)}{P(R = 1)} \\ &= (P(R = 1|E = 1, N = 0)P(N = 0) + \\ &\quad P(R = 1|E = 1, N = 1)P(N = 1)) \frac{P(E = 1)}{P(R = 1)} \end{aligned}$$

This therefore  $P(E = 1|R = 1) > 1$ , likewise

$$\begin{aligned} P(N = 0|R = 1) &= P(R = 1|N = 0) \frac{P(N = 0)}{P(R = 1)} \\ &= (P(R = 1|E = 1, N = 0)P(E = 1) + \\ &\quad P(R = 1|E = 0, N = 0)P(E = 0)) \frac{P(N = 0)}{P(R = 1)} \end{aligned}$$

This therefore  $P(E = 1|R = 1) > 1$ , therefore,  $P(E = 1|R = 1)P(N = 0|R = 1) > 0$  and is not equal to  $P(E = 1, N = 0|R = 1)$  therefore they are conditionally dependent. Ie they are not independent given R

## Problem 2

(a)

$$\boxed{P(a, b, c, d) = P(c)P(a|c)P(d)P(b|a, d)}$$

**(b)**

$$\begin{aligned} P(C, D) &= \sum_A P(C, D, A) \\ &= \sum_A P(A)P(C|A)P(D|A) \\ &= \sum_A P(C)P(A|C)P(D|A) \\ &= P(C) \sum_A P(A|C)P(D|A) \end{aligned}$$

In order for this to be independent we must have that  $\sum_A P(A|C)P(D|A) = P(D)$ . This will occur if and only if  $P(D|A) = P(D)$  or  $P(A|C) = P(A)$ , this generally will not hold true because that would mean that either  $A$  is independent of  $C$  or  $A$  is independent of  $D$ , neither of which should hold true. Therefore  $C$  and  $D$  are not independent.

**(c)**
